

Cryptography

DAT159

By Sondre Gjellestad and Arne Molland

Task 1

After setting up the certificate, the connection works.

```
Message to TCPServer: Message from TC
P SSLClient
Response from Server: HTTP/1.1 200 OK
```

Run | Debug

```
public static void main(String[] args) throws InvalidKeyException, NoSuchAlgorithmException,
    NoSuchPaddingException, UnrecoverableKeyException, KeyStoreException {
    // Set the truststore dynamically using the system property

    System.setProperty("javax.net.ssl.trustStore", "keys/tcp_truststore");
    System.setProperty("javax.net.ssl.trustStorePassword", "abcdef");

    String message = "Message from TCP SSLClient";
    TCPClientSSLRSA c = new TCPClientSSLRSA(ServerConfig.SERVER, ServerConfig.PORT);
    c.clientProcess(message);
}
```

Task 4 | Tamper with the Message (Integrity)

After setting up the proxy certificates, we've set a breakpoint like this:

After tampering with the message this is the result.

```
java.io.IOException: Server returned  
HTTP response code: 502 for URL: http  
s://localhost:9085/Message from HTTPS  
client-233EF8ED6D14DB4D2C191A7B31B7B

```

Question

Can we impersonate `HttpsClientProxySSLRSA` in this setup? If so, we would need it's private key in order to sign messages correctly.
